4. Der Integralsatz von Stokes

Definition

Sei $\Phi = (\Phi_1, \Phi_2, \Phi_3)$ eine Fläche mit Parameterbereich $B \subseteq \mathbb{R}^2, D \subseteq \mathbb{R}^2$ offen, $B \subseteq D, \Phi \in C^1(D, \mathbb{R}^3)$ und $S = \Phi(B)$.

Für $f: S \to \mathbb{R}$ stetig und $F: S \to \mathbb{R}^3$ stetig:

$$\int_{\Phi} f \, \mathrm{d}\sigma \qquad := \int_{B} f \left(\Phi(u,v) \right) \cdot \| \, N(u,v) \, \| \, \mathrm{d}(u,v) \\ \int_{\Phi} F \cdot n \, \mathrm{d}\sigma \quad := \int_{B} F \left(\Phi(u,v) \right) \cdot N(u,v) \, \mathrm{d}(u,v)$$
 Oberflächenintegrale

Beispiele 4.1

- (1) Für $f \equiv 1: \int_{\Phi} 1 \, \mathrm{d}\sigma =: \int_{\Phi} \mathrm{d}\sigma = I(\Phi)$
- (2) Sei $B := \{(u,v) \in \mathbb{R}^2 : u^2 + v^2 \le 1\}, \; \Phi(u,v) := (u,v,u^2+v^2), \; F(x,y,z) \; = \; (x,y,z)$ Bekannt: $N(u,v) = (-2u, -2v, 1), \ F(\Phi(u,v)) = (u,v,u^2+v^2) \Rightarrow \int_{\Phi} F \cdot n \ d\sigma = \int_{B} (u,v,u^2+v^2) \cdot (-2u, -2v, 1) d(u,v) = -\int_{B} (u^2+v^2) d(u,v) \stackrel{u=r\cos\varphi,v=r\sin\varphi}{=} -\int_{0}^{2\pi} (\int_{0}^{1} r^3 dr) d\varphi = -\frac{\pi}{2}$

Satz 4.2 (Integralsatz von Stokes)

 B, D, Φ seien wie oben. B sei zulässig, $\partial B = \Gamma \gamma$, wobei $\gamma = (\gamma_1, \gamma_2)$ wie in §2. Es sei $\Phi \in C^2(D, \mathbb{R}^3), G \subseteq \mathbb{R}^3$ sei offen, $F \subseteq G$ und $F = (F_1, F_2, F_3) \in C^1(G, \mathbb{R}^3)$. Dann:

$$\underbrace{\int_{\Phi} \operatorname{rot} F \cdot n \, \mathrm{d}\sigma}_{\text{Oberflächenintegral}} = \underbrace{\int_{\Phi \circ \gamma} F(x,y,z) \, \mathrm{d}(x,y,z)}_{\text{Wegintegral}}$$

$$\varphi := \Phi \circ \gamma, \varphi = (\varphi_1, \varphi_2, \varphi_3), \text{ also: } \varphi_j = \Phi_j \circ \gamma \quad (j = 1, 2, 3)$$
Zu zeigen:
$$\int_{\Phi} \operatorname{rot} F \cdot n \, d\sigma = \int_0^{2\pi} F(\varphi(t)) \cdot \varphi'(t) dt = \sum_{j=1}^3 \int_0^{2\pi} F_j(\varphi(t)) \cdot \varphi'_j(t) dt$$
Es ist
$$\int_{\Phi} \operatorname{rot} F \cdot n \, d\sigma = \int_B \underbrace{(\operatorname{rot} F)(\Phi(x, y)) \cdot (\Phi_x(x, y) \times \Phi_y(x, y))}_{=:q(x, y)} d(x, y)$$

$$F\ddot{u}r \ j = 1, 2, 3: g_j(x, y) := \underbrace{(F_j(\Phi(x, y)) \frac{\partial \Phi_j}{\partial y}(x, y), \underbrace{-F_j(\Phi(x, y)) \frac{\partial \Phi_j}{\partial x}(x, y)}_{=:v_j(x, y)}, \underbrace{-F_j(\Phi(x, y)) \frac{\partial \Phi_j}{\partial x}(x, y), \underbrace{-F_j(\Phi(x, y)) \frac{\partial \Phi_j}{\partial x}(x, y)}_{=:v_j(x, y)}, (x, y) \in D$$

$$F \in C^1, \Phi \in C^2 \Rightarrow a_i \in C^1(D, \mathbb{R}^2)$$

 $F \in C^1, \Phi \in C^2 \Rightarrow g_i \in C^1(D, \mathbb{R}^2)$

Nachrechnen:
$$g = \text{div } g_1 + \text{div } g_2 + \text{div } g_3 \Rightarrow \int_{\Phi} \text{rot } F \cdot n \, d\sigma = \sum_{j=1}^{3} \int_{B} \text{div } g_j(x,y) d(x,y)$$

$$\int_{B} \text{div } g_j(x,y) d(x,y) \stackrel{2.1}{=} \int_{\gamma} (u_j dy - v_j dx) = \int_{0}^{2\pi} (u_j (\gamma(t)) \cdot \gamma'_2(t) - v_j(\gamma(t)) \cdot \gamma'_1(t)) \, dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t)) dt = \int_{0}^{2\pi} F_j(\varphi(t)) \cdot \varphi'_j(t) dt \Rightarrow \int_{\Phi} \text{rot } F \cdot n d\sigma = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t)) dt = \int_{0}^{2\pi} F_j(\varphi(t)) \cdot \varphi'_j(t) dt \Rightarrow \int_{\Phi} \text{rot } F \cdot n d\sigma = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) + F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial x} \gamma(t) \gamma'_1(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \frac{\partial \Phi_j}{\partial y} \gamma(t) \gamma'_2(t) dt = \int_{0}^{2\pi} (F_j(\varphi(t)) \gamma'_2(t) dt = \int_{0$$

$$\sum_{j=1}^{3} \int_{B} \operatorname{div} g_{j}(x, y) \operatorname{d}(x, y) = \sum_{j=1}^{3} \int_{0}^{2\pi} F_{j}(\varphi(t)) \cdot \varphi'_{j}(t) \operatorname{d}t$$

4. Der Integralsatz von Stokes

Beispiel

 B, Φ, F seien wie in Beispiel 4.1.(2). $\gamma(t) = (\cos t, \sin t), t \in [0, 2\pi]$. Verifiziere 4.2 Hier: $\cot F = 0$, also $\int_{\Phi} \cot F \cdot n d\sigma = 0$. $(\Phi \circ \gamma)(t) = (\cos t, \sin t, 1) \Rightarrow \int_{\Phi \circ \gamma} F(x, y, z) d(x, y, z) = \int_{0}^{2\pi} (\cos t, \sin t, 1) \cdot (-\sin t, \cos t, 0) dt = 0$
